

Demystifying and exploiting IoT Timeout Behaviors in Smart Home

Chenglong Fu

Assistant Professor

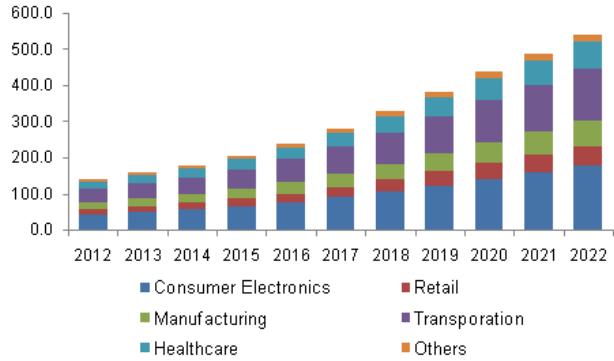

Department of Software and Information Systems

UNC Charlotte

chenglong.fu@uncc.edu

Global Internet of Things (IoT) Market Size To Hit USD 1,842 Billion by 2028 at a 24.5% CAGR Growth (with COVID-19 Analysis): Facts & Factors

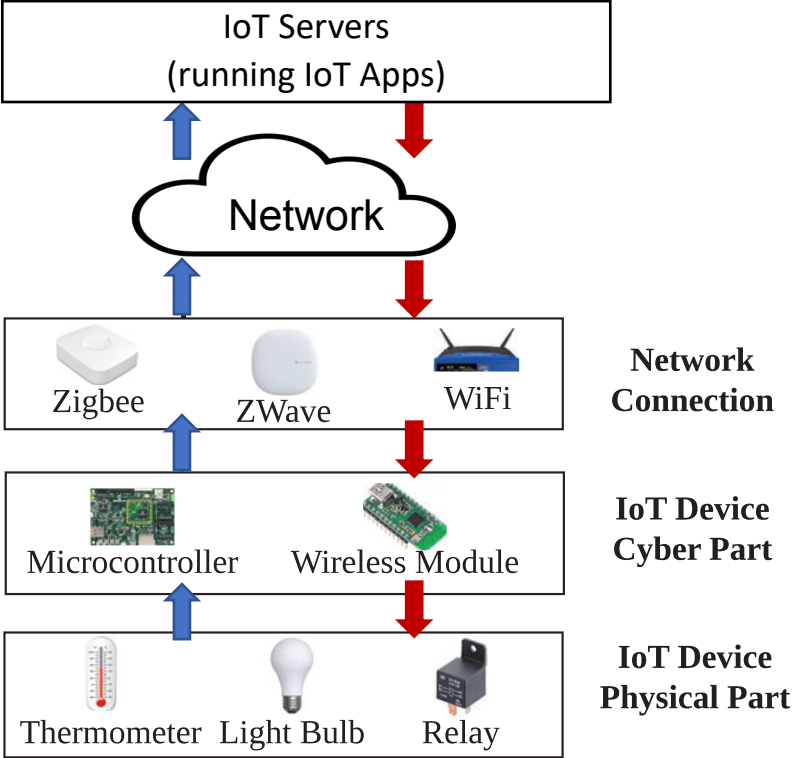

Booming of the Internet of Things Market

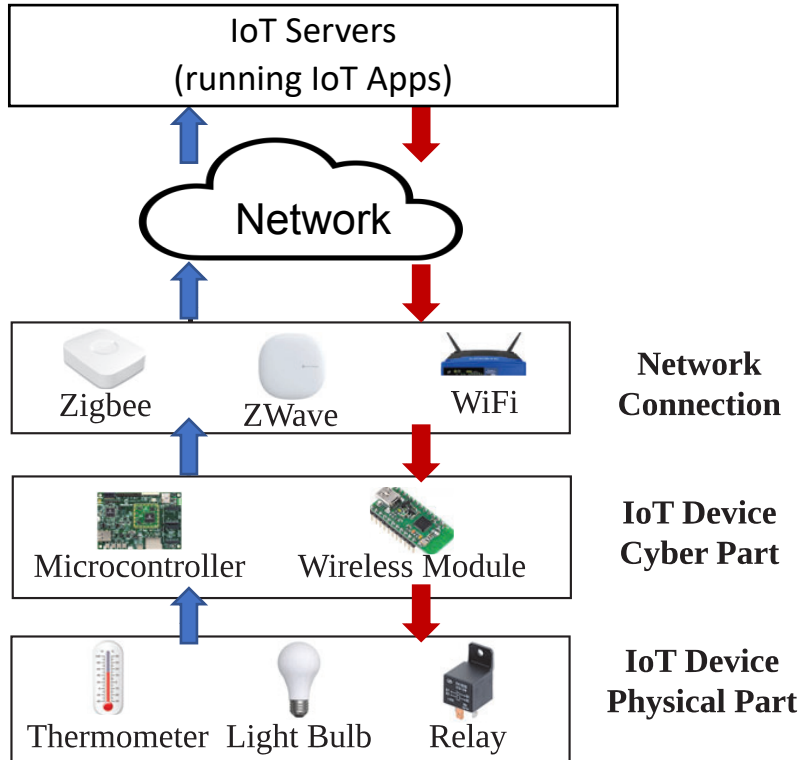

- More than 10 billion active IoT devices
- \$400 billion IoT market size
- 43% smart home device household penetration rate

Background: IoT Architecture

Background: IoT Architecture

- **↑ IoT Event**
 - E.g., lock status
 - Flow from device to server
- **↓ IoT Command**
 - E.g., unlock door
 - Flow from server to device

Background: IoT Architecture

- **↑ IoT Event**
 - E.g., lock status
 - Flow from device to server
- **↓ IoT Command**
 - E.g., unlock door
 - Flow from server to device
- IoT App (aka, smart app/routine/rule)
 - **Trigger:** when motion-on (**event**) is received
 - **Condition:** if presence sensor is present
 - **Action:** turn off indoor-camera (**command**)

IoT Devices

IoT Servers

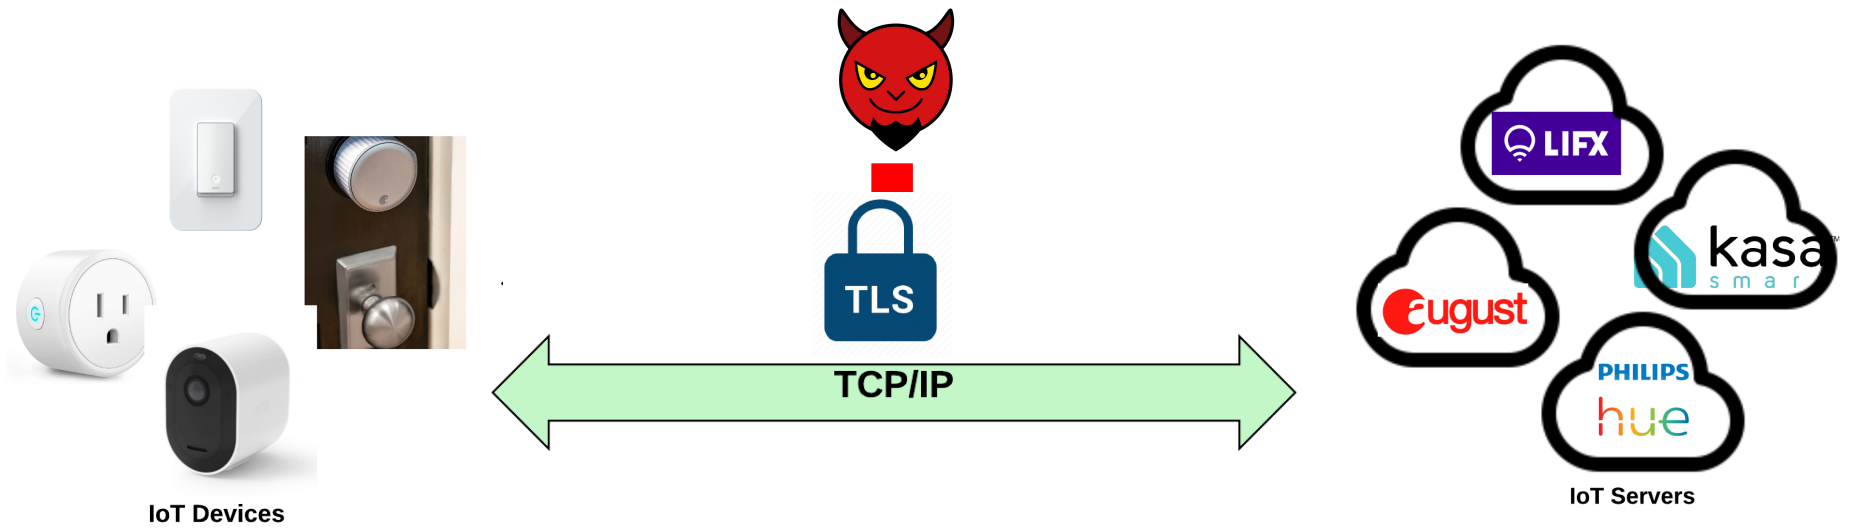

74% of IoT devices use TCP/IP

Zigbee and ZWave devices are connected to IoT hubs, which also use TCP/IP

74% of IoT devices use TCP/IP

Zigbee and ZWave devices are connected to IoT hubs, which also use TCP/IP

Message Integrity Protection

Tampering attempts: alert, session termination

TLS Message Integrity Protection

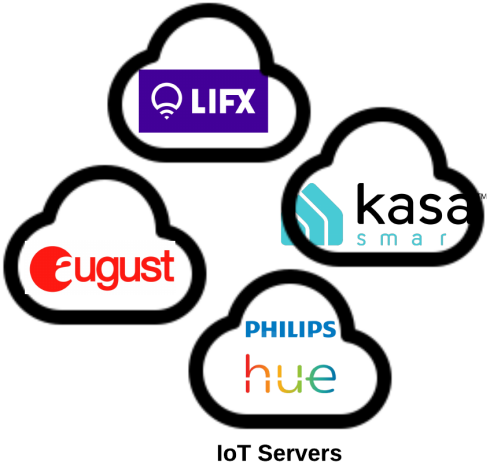

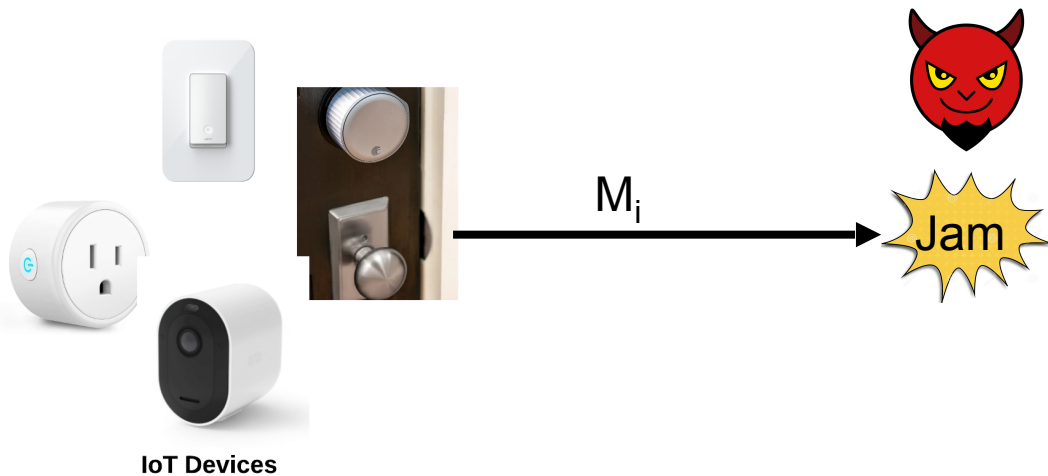

IoT Devices

IoT Servers

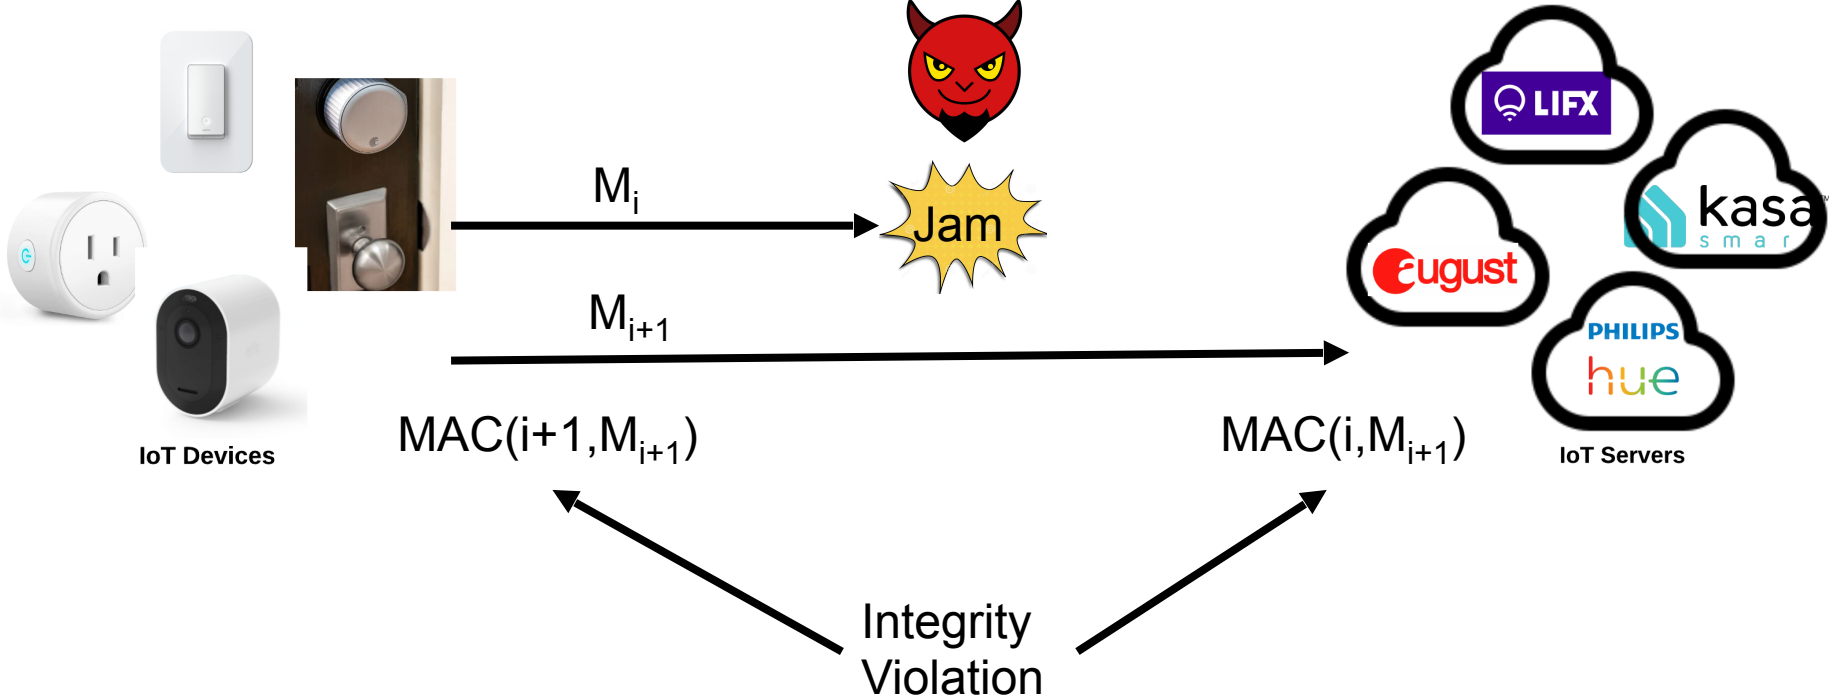

TLS Message Integrity Protection

TLS Message Integrity Protection

TLS Message Integrity Protection

- TCP
 - “picky” about delay

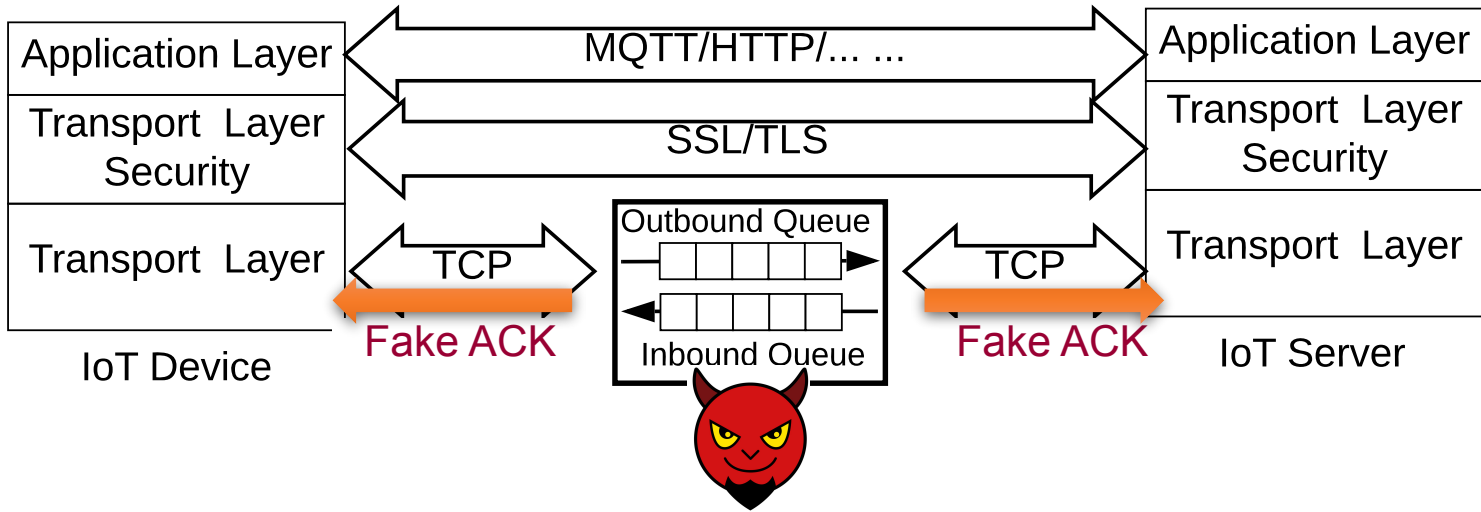

- TCP
 - “picky” about delay
- TLS (Transport Layer Security)
 - Cannot drop, inject, modify or disorder data packets

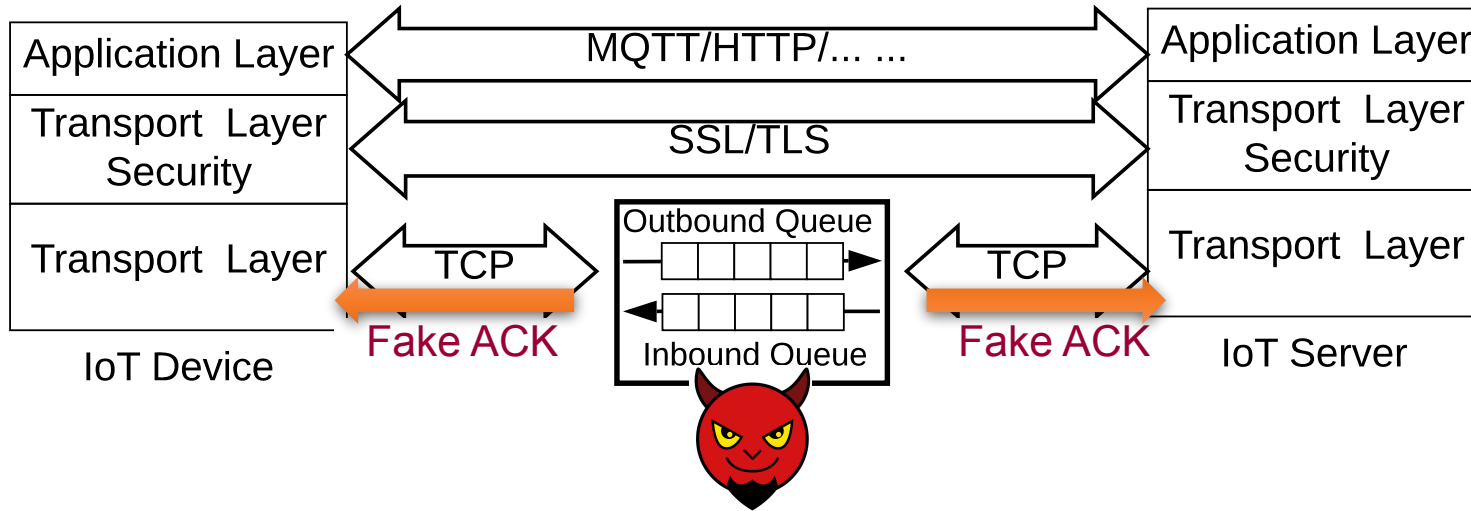

- TCP
 - “picky” about delay
- TLS (Transport Layer Security)
 - Cannot drop, inject, modify or disorder data packets

Key Insight 1:

Delay detection in the TCP layer is **decoupled** from data protection by TLS

What if the attacker **injects** fake TCP ACK packets and **delays** TLS packets?

TCP will not complain!

TLS will not complain either!

The delay is only constrained by the **Application layer**, which we find is quite **insensitive** to delay

Questions...

- How to hijack the TCP traffic?

Questions...

- How to hijack the TCP traffic?
 - ARP spoofing: easy to launch [IoTInspector: IMWUT'20]
 - Shared network, Hotel, office, campus, remote attacker
- How to infer IoT messages from encrypted traffic?

Questions...

- How to hijack the TCP traffic?
 - ARP spoofing: easy to launch [IoTInspector: IMWUT'20]
 - Shared network, Hotel, office, campus, remote attacker
- How to infer IoT messages from encrypted traffic?
 - Side-channel attacks: *packet length, DNS query, ...*
 - Accuracy: 97% [PingPong: NDSS'20]
- What is the delay constraint imposed on the App layer?

Questions...

- How to hijack the TCP traffic?
 - ARP spoofing: easy to launch [IoTInspector: IMWUT'20]
 - Shared network, Hotel, office, campus, remote attacker
- How to infer IoT messages from encrypted traffic?
 - Side-channel attacks: *packet length, DNS query, ...*
 - Accuracy: 97% [PingPong: NDSS'20]
- What is the delay constraint imposed on the App layer?
 - **Challenges**: diverse IoT devices + proprietary protocols

 - A keep-alive message must be ack-ed within a threshold?
 - Categorization?

Application Layer Timeout Behavior

- Two types of messages
 - Normal messages: on occurring of events/commands
 - Keep-alive messages: periodically exchanged
- Timeout Behavior Measurement
 - Keep-alive pattern: on-idle/periodic, length of period
 - Message timeout
 - Normal message timeout
 - Keep-alive message timeout
- Predicting the happening of timeout while delaying a normal message

No.	Device Type	Device Model	App Install	Long-live Session	Keep-alive Messages			Event Messages		Command Messages

Phantom-Delay Attack Primitives

- IoT Event Message Delay (E-Delay)
- IoT Command Message Delay (C-Delay)

IoT events and commands can be delayed **without**

(1) relying on any implementation bugs: usable

(2) cracking any TLS session keys: easy-to-apply

(3) triggering any alerts in any layers: stealthy

IoT Phantom Delay Attacks

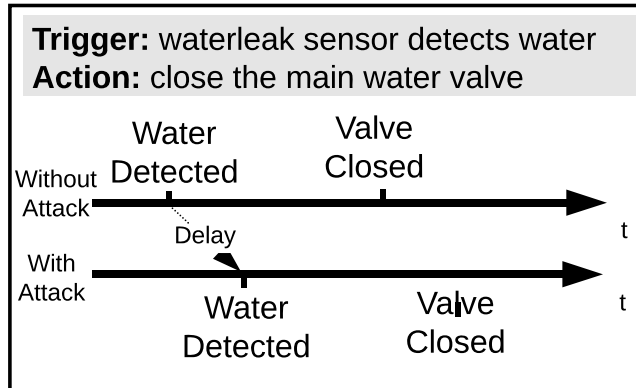

- What are the new attack primitives?
 - E-Delay; C-Delay
- What simple attacks can be launched?
- What sophisticated attacks can be launched?
- What are the possible countermeasures?

- State-Update Delay Attacks

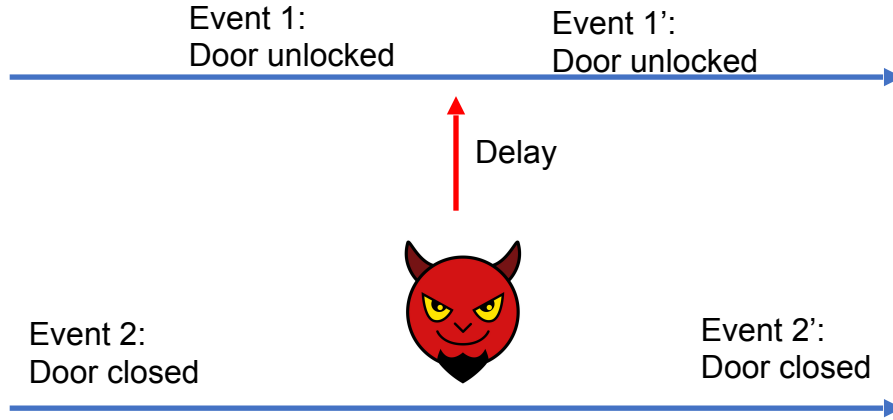

- Action Delay Attacks

IoT Phantom Delay Attacks

- What are the new attack primitives?
 - E-Delay; C-Delay
- What simple attacks can be launched?
 - *“Fire alarm is delayed”, “Remedy actions delayed”*
- What sophisticated attacks can be launched?
- What are the possible countermeasures?

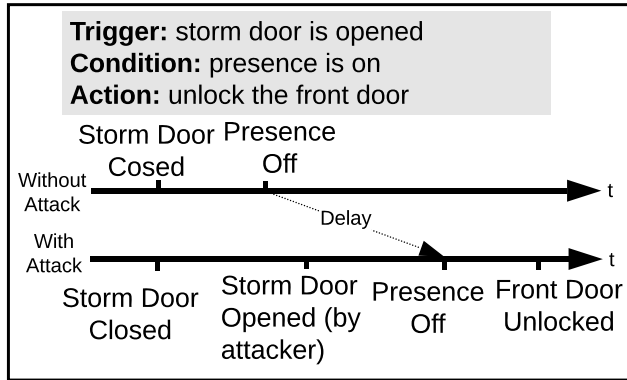

SmartThings

Key Insight 2:

Each device has an **individual** TCP-TLS session to its IoT server

Selective Delay → Message Out-of-order

• Spurious Execution

• Disabled Execution

IoT Phantom Delay Attacks

- What are the new attack primitives?
 - E-Delay; C-Delay
- What simple attacks can be launched?
 - *“Fire alarm is delayed”, “Remedy actions delayed”*
- What sophisticated attacks can be launched?
 - *“Spurious unlock”, “Door lock override”*
- What are the possible countermeasures?

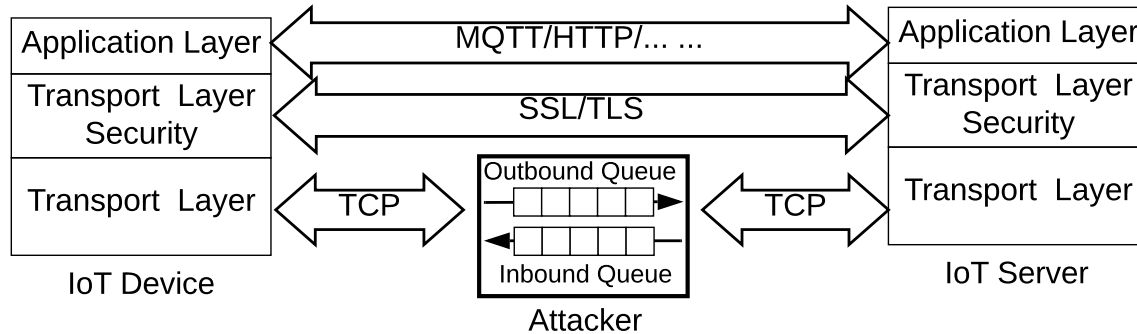

Possible Countermeasures

- Checking timestamp upon receiving a message
 - **Limitations:** post-attack detection; clock sync
- Tightening the app-layer delay constraint
 - **Limitations:** traffic and energy consumption; false positives

Possible Countermeasures

- Checking timestamp upon receiving a message
 - **Limitations:** post-attack detection; clock sync
- Tightening the app-layer delay constraint
 - **Limitations:** traffic and energy consumption; false positives

Common Limitation: the countermeasures need to update the firmware of billions of IoT devices

Local IoT Server: **Not** a Countermeasure

Local IoT Server: **Not** a Countermeasure

Local IoT Server: **Not** a Countermeasure

Case Study: Apple Homekit

- Local IoT servers: HomePod, Apple TV, or iPad
- No application layer event ack (HAP specification)
- No keep-alive messages
- Unlimited delay until the hub occasionally polling

Label	Device Model	Event Messages

More than 20 mins delay!

Is TCP+TLS really suitable for IoT?

Is TCP+TLS really suitable for IoT?

A Flaw:

We **cannot** trust the TCP layer to detect network delays (as it is decoupled from the data protection by TLS)

Is TCP+TLS really suitable for IoT?

A Flaw:

We **cannot** trust the TCP layer to detect network delays (as it is decoupled from the data protection by TLS)

A Dilemma:

We **should not** use the Application layer to detect network delays (as its **timeout threshold** needs to take into consideration scheduling, automation processing, and constrained devices)

Not an issue of one or two IoT platforms or devices;
all IoT platforms we tested have it

Attack script and detailed steps to reproduce the attack is
available at
<https://github.com/infinitywings/IoT-Phantom-Delay-Attack>

other in Google Nest Security Alarm System

■ ACCEPTED

Google VRP

13.07.2021

“We will report this vulnerability to the product team and **reduce the value of timeout**” — SimpliSafe

“We appreciate your suggestions and **will evaluate our TLS keep alive and connection timeout strategy** for our current timeout thresholds. We also have a mitigation strategy in place so in the future it will **be harder for an attacker to discern commands based on packet size or TCP segment length.**” — Ring

Contributions

- The **first** work that studies IoT timeout behaviors and their exploitability
 - Revealed a critical design flaw
- **IoT phantom-delay attack primitives**
 - No alerts; no packet loss; no disconnection; no bugs
- **Rich attacks: delay, disable, override automation**
- **Uniqueness** (compared to delays in distributed systems)
 - Zero implementation bugs vs. specific bugs
 - IoT over TCP/IP vs. specialized systems

Thanks!
